Profile

Platform Engineering professional with hands-on experience in middleware, mainframe, and enterprise infrastructure automation. Currently expanding expertise in Linux, cloud, Kubernetes, and modern DevOps practices, with a focus on building reliable automation products and self-service capabilities that reduce manual effort, improve platform resilience, and create measurable business value.

Skills

Ansible Automation Platform, Jenkins, Vault, PowerShell, Shell/Bash, Python, Groovy, Docker, Nexus, REST APIs, Splunk

Experience

Infrastructure Automation 2024.2 - Present HSBC GZ,China

- Own day-to-day operations, incident management, patching, and automation for 5 enterprise middleware products, including Azul Java, SAJAVA, JWS, Liberty, and WAS; developed into a product SME within the first year, supporting production troubleshooting, version upgrades, configuration standardization, and platform reliability improvements.
- Designed and delivered an end-to-end automated middleware log collection, transfer, and vendor upload platform for WAS and Liberty using Ansible Automation Platform, Shell/Bash, Python callback plugins, HashiCorp Vault, Splunk, and SFTP. Automated 3+ diagnostic operations, including javadump, heapdump, and linperf, and standardized 8+ workflow steps across log collection, sanitization, compression, staging transfer, credential and OTP retrieval, vendor upload, execution reporting, and audit monitoring.
- Led the development of Ubuntu Base Image Vulnerability Remediation Automation using Groovy, Jenkins Pipeline, Docker, Nexus, GitHub Enterprise API, CyberFlows, and JSON to automate image builds, vulnerability scanning, CVE baseline comparison, pull request merging, production image promotion, and email reporting; reduced the CVE exposure window from at least 4 weeks to within 1 week, achieving an approximate 75% reduction.
- Onboarded Azul Java Provisioning into the ITSP self-service portal by integrating JSON low-code forms, REST APIs, Ansible Roles, YAML, Jinja2 and Shell/Bash templates, automating the end-to-end flow from front-end configuration to back-end environment provisioning. Covered 10+ configuration areas, including VM, OS, resource sizing, backup, disk, ports, Centrify, NLB, and SSL settings, reducing user configuration time by approximately 40%.
- Built internal infrastructure automation workflows for bulk VM management, OS patching, and lease renewal, leveraging GitOps practices, PowerShell, and operational runbooks to reduce repetitive BAU activities, improve server lifecycle management efficiency, and strengthen change audibility across internal environments.

System Automation Specialist 2021.8 - 2024.2 HSBC GZ,China

- Managed and enhanced enterprise automation platforms including Automation Point for IBM i and Broadcom OPS/MVS for IBM Z, supporting global application, batch, and infrastructure automation requirements across multiple regions.
- Designed and implemented mainframe automation workflows for z/OS IPL, disaster recovery, automated message handling, and command execution, supporting critical technology domains including MQ, CICS, DB2, and JES2.
- Automated 7 end-to-end batch procedures for 3 applications, eliminating around 28 monthly privileged access requests and saving approximately 850 minutes of manual operational effort per month.
- Delivered monitoring and event automation for started tasks, subsystems, online applications, CPU usage, network issues, batch failures, and storage errors, improving incident detection, alert accuracy, and operational responsiveness.
- Enhanced automation reliability through script optimization and rule refinement, releasing 4 changes that reduced around 25 monthly incidents assigned to the support team.
- Performed annual platform upgrades and security patching for Automation Point, Apache Tomcat, and 10+ Windows servers across UAT and Production, maintaining service availability through controlled patching and server role swap procedures.

Infrastructure Operations 2018.08 - 2021.08 HSBC GZ,China

- Led workload transfer from the HK data center to the Guangzhou local data center, supporting migration planning, execution coordination, and post-migration validation to minimize service disruption.
- Performed batch scheduling, monitoring, and incident handling for IBM i and IBM Z systems using Control-M, CA7, TWS, BES Console, and CA Service Desk, ensuring stable production operations and timely job completion.
- Monitored critical batch flows, handled job failures, coordinated escalations with application and infrastructure teams, and supported SLA adherence across production environments.
- Standardized runbooks and operational procedures, and conducted knowledge-sharing sessions with global teams in India and Mexico to improve process consistency, handover quality, and operational efficiency.
- Collaborated with automation teams to define scheduling plans, trigger conditions, dependency logic, and success/failure checkpoints, enabling process improvement and reducing manual intervention.
- Delivered monthly performance reporting on SLA breaches, MTTT, MTTR, incident trends, and site performance, while supporting emergency procedures during typhoons and black rainstorms to maintain service continuity.

System Operations Analyst 2016.03 - 2018.08 IBM SZ, China

- Monitored and managed production alerts from IBM Mainframe and AS400 environments, proactively identifying potential batch, system, and application issues, and escalating to relevant support teams for timely resolution.

- Executed weekly IPL Initial Program Load procedures across multiple systems during approved change windows, coordinating with CICS, MQ, DB2, JES2, and application teams to ensure controlled shutdown, restart, and recovery activities.
- Scheduled, monitored, and managed production batch jobs using Control-M, CA7, TWS, and ISPF, ensuring timely execution of critical workloads across mainframe and distributed platforms.
- Investigated and resolved batch job failures by analyzing job logs, identifying error conditions, updating or validating JCL scripts, and rerunning jobs to restore normal production processing.
- Supported production incident management by performing first-level troubleshooting, coordinating escalations, and maintaining operational stability with minimal service disruption.

Associate Software Engineering 2015.06 - 2016.03 Accenture DL,China

- Participated in the full waterfall software development lifecycle, covering requirement analysis, technical design, coding, testing, deployment, and production maintenance for an insurance policy inputting system.
- Developed and enhanced application functionalities using Informix-4GL and SQL, supporting incremental system improvements, defect fixes, and performance optimization.
- Integrated back-end banking systems with the insurance policy inputting platform, ensuring accurate data exchange, process consistency, and reliable end-to-end transaction flow.
- Conducted unit testing, supported system testing and deployment activities, and resolved defects across development phases to ensure stable and timely project delivery.
- Participated in code reviews, daily task planning, and team coordination, contributing to code quality, delivery transparency, and effective collaboration within the development team.

Education

Dalian Institute of Science and Technology;Dalian China – Bachelor,2015

Certifications

Google cloud certified - Professional Cloud Architect
 PMI-Agile Certified Practitioner
 ITIL v4 Certified
 Deep Learning Specialization
